#### Volume 38

Antelope Valley Astronomy Club Newsletter

April 2018

#### **Up-Coming Events**

- April 7: Prime Desert Moon Walk
- April 13: Club Meeting\*
- April 14: Messier Marathon
- April 27: College of the Canyons Star Party

\* Monthly meetings are held at the S.A.G.E. Planetarium in Palmdale, the second Friday of each month. The meeting location is at the northeast corner of Avenue R and 20<sup>th</sup> Street East. Meetings start at 7 p.m. and are open to the public. *Please note that food and drink are not allowed in the planetarium* 

## President

#### Frank Moore

Will wonders never cease? We called one right for a change. Whether you knew it or not, way back in January the AVAC Board decided to hold our Messier Marathon on the New Moon weekend in April rather than March out of concern for the weather. Of course, from an astronomical perspective, March 17 would have been the ideal weekend

as far as "bagging Messier Objects" is concerned but we had reservations about the mid-March weekend and the weather that early in the month.

As it turned out we were right since the turned out to be mostly inclement at our regular observing sites. In addition to being cloudy (as was the entire state) Chuchupate was snow bound and both the Ventura County Astronomical Society (VCAS) and the Local Group Astronomy Club out of Santa Clarita canceled their Messier Marathons.

Ultimately, I finally made the call to cancel our scheduled star party at Red Cliffs (Red Rock Canyon State Park) due to clouds, wind and predicted thunderstorms. Three hours after I canceled, the Supervising Ranger for the district notified me that he was canceling all events in the park. I had loaded our motor home the night before and by the time I started to unload it was snowing here in Tehachapi.

So, we'll try it again. We have the Group Campsite at Saddleback Butte State Park reserved for the afternoon and night of Saturday April 14 into Sunday morning. Though it's not our formal picnic (that's in July) we'll light off the barbecues for kind of a "BYOM" (bring your own meat) potluck where you're free bring just enough for yourself or some extra to share. We'll have water, soda, coffee, cocoa and midnight snacks for those observing through the night. Details and directions will be sent in another email.

For those who missed it, our March meeting was a bit out of the ordinary as we incorporated it into the 20th Anniversary Celebration for the SAGE Planetarium. Festivities began at 4:30 with speeches by school and government officials and a reception with deli sandwiches, donuts and other treats in the lobby of the SAGE. I was especially fascinated, and heartened, by the stories from the original board members who had the insight to forethought to build the planetarium over twenty years ago. Though we had a few telescopes set up for both solar deep sky observing, weather conditions pretty well prevented us from observing

#### 2

## **Desert Sky Observer**

anything but the Orion Nebula through holes in the overcast. Still, the grateful crowd seemed to be pleased to see even that.

As was the case with the rest of the events for March, the Prime Desert Woodland Moonwalk for March was rained out. We can't complain too much about the rain and snow though since it was a bit of a "Miracle March" with the highest recorded precipitation for the month since 1991. Though still well below normal for the year, the March storms increased the Sierra Nevada snow pack to 58% of normal for April 1 and saved us from another summer of severe drought.

The April moonwalk is scheduled for Saturday April 7 at 8:00 pm and our April meeting will be on Friday April 13. Rose has speakers scheduled for both the April and May meetings as noted in her DSO article. The College of the Canyons Spring Star Party is on Friday April 27. The AVAC will have a presence at the College of the Canyons Star Party though Rose and I will not be able to attend as we will be in Lincoln City, Oregon (the se place we went for the solar eclipse) for our son's wedding. This is a fun event, with an enthusiastic crowd, and I hope we can have a decent showing of members with telescopes.

It's warming up, the skies are getting clearer, so remember to go outside and LOOK UP.

# Secretary

#### **Rose Moore**

Thank you to all the members who ce out to the SAGE's 20th Anniversary celebration on March 9th. We had cloudy skies, so not much observing for us and the public, and lots of donuts!

Further info on the Mt. Wilson trip in June will be coming, where and time to meet up, carpooling, maps, etc.

Coming up in April is our Prime Desert Moon Walk with Jeremy on Saturday April 7th at 8pm. We'll need members with telescopes, or come out to enjoy the walk and talk with Jeremy! Weather permitting!

At our meeting in April we will have Alejandro Osorio, the Operations Engineer and Mission Director for the C-20 Airborne Science aircraft which supports JPL's UAVSAR program. This mission uses a modified Gulfstream aircraft using special radar, that is used to gather scientific data for geological studies on how land changes, hurricanes, climate changes in the Arctic, and changes in Earth's features after earthquakes and volcanoes. This type of radar instrumentation has been used on planetary missions such as the Venera and Magellan Venus probes, and on the Cassini probe for gathering information on Titan. This mission is a joint NASA and JPL mission.

Our Messier Marathon is coming up on Saturday, April 14th. We will be meeting at the group campsite at Saddleback State Park at a time to be announced. Bring your telescopes, or you can come and view through other member's telescopes, and enjoy the night sky. This is an overnight event for those interested. Dress warm, weather permitting!

Friday April 27th is College of the Canyons. We will need members with telescopes, or other astronomy items of interest, to show the public the night sky. Frank and I usually attend this event, but we will be out of town for our son's wedding. So we would appreciate some members to help out at this event! Further info to follow.

#### 3

## **Desert Sky Observer**

Our speaker at May's meeting will be Chris Butler artist, speaker, educator, and astronomer. Chris is a member of the Orange County Astronomers and the LAAS. He has been a speaker at our meetings numerous times. His topic for May's meeting is 'From Nine Planets to Nine Billion Worlds'.

Please come out and support your club at our meetings and our outreach events.

## Measuring the Movement of Water on Earth

By Teagan Wall

As far as we know, water is essential for every form of life. It's a simple molecule, and we know a lot about it. Water has two hydrogen atoms and one oxygen atom. It boils at  $212^{\circ}$  Fahrenheit ( $100^{\circ}$  Celsius) and freezes at  $32^{\circ}$  Fahrenheit ( $0^{\circ}$  Celsius). The Earth's surface is more than 70 percent covered in water.

On our planet, we find water at every stage: liquid, solid (ice), and gas (steam and vapor). Our bodies are mostly water. We use it to drink, bathe, clean, grow crops, make energy, and more. With everything it does, measuring where the water on Earth is, and how it moves, is no easy task.

The world's oceans, lakes, rivers and streams are water. However, there's also water frozen in the ice caps, glaciers, and icebergs. There's water held in the tiny spaces between rocks and soils deep underground. With so much water all over the planet—including some of it hidden where we can't see— NASA scientists have to get creative to study it all. One way that NASA will measure where all that water is and how it moves, is by launching a set of spacecraft this spring called GRACE-FO.

GRACE-FO stands for the "Gravity Recovery and Climate Experiment Follow-on." "Follow-on" means it's the second satellite mission like this—a follow-up to the original GRACE mission. GRACE-FO will use two satellites. One satellite will be about 137 miles (220 km) behind the other as they orbit the Earth. As the satellites move, the gravity of the Earth will pull on them.

Gravity isn't the se everywhere on Earth. Areas with more mass—like big mountains—have a stronger gravitational pull than areas with less mass. When the GRACE-FO satellites fly towards an area with stronger gravitational pull, the first satellite will be pulled a little faster. When the second GRACE-FO satellite reaches the stronger gravity area, it will be pulled faster, and catch up.

Scientists combine this distance between the two satellites with lots of other information to create a map of Earth's gravity field each month. The changes in that map will tell them how land and water move on our planet. For exple, a melting glacier will have less water, and so less mass, as it melts. Less mass means less gravitational pull, so the GRACE-FO satellites will have less distance between them. That data can be used to help scientists figure out if the glacier is melting.

GRACE-FO will also be able to look at how Earth's overall weather changes from year to year. For example, the satellite can monitor certain regions to help us figure out how severe a drought is. These satellites will help us keep track of one of the most important things to all life on this planet: water.

You can learn more about our planet's most important molecule here: https://spaceplace.nasa.gov/water

## **News Headlines**

#### NASA is Ready to Study the Heart of Mars

InSight -- short for Interior Exploration using Seismic Investigations, Geodesy and Heat Transport -- is a stationary lander scheduled to launch as early as May 5. It will be the first mission ever dedicated to Mars' deep interior, and the first NASA mission since the Apollo moon landings to place a seismometer on the soil of another planet.

https://www.jpl.nasa.gov/news/news.php?feature=7090

#### Kepler Beyond Planets: Finding Exploding Star

Stellar explosions forge and distribute materials that make up the world in which we live, and also hold clues to how fast the universe is expanding. By understanding supernovae, scientists can unlock mysteries that are key to what we are made of and the fate of our universe. But to get the full picture, scientists must observe supernovae from a variety of perspectives, especially in the first moments of the explosion. That's really difficult -- there's no telling when or where a supernova might happen next. https://www.jpl.nasa.gov/news/news.php?feature=7086

#### 100th Spacewalk by Space Station Expedition Crews

Two U.S. astronauts worked outside of the International Space Station Thursday on what marked the 100th spacewalk performed by crew members living on board the orbiting laboratory. Expedition 55 crewmates Drew Feustel and Ricky Arnold, both of NASA, spent six hours and 10 minutes conducting maintenance activities on the exterior of the space station.

#### R Aquarii: Watching a Volatile Stellar Relationship

In biology, "symbiosis" refers to two organisms that live close to and interact with one another. Astronomers have long studied a class of stars — called symbiotic stars — that co-exist in a similar way. Using data from NASA's Chandra X-ray Observatory and other telescopes, astronomers are gaining a better understanding of how volatile this close stellar relationship can be. http://chandra.si.edu/photo/2017/ragr/

#### **Ghostly Galaxy Has Almost No Dark Matter**

A unique galaxy is making the case for dark matter, even though it has very little of the mysterious substance. Astronomers have determined that the galaxy NGC 1052-DF2, or DF2 for short, has 400 times less dark matter than expected for an object of its size.

https://www.space.com/40119-ghostly-galaxy-almost-no-dark-matter.html

## **Desert Sky Observer**

## **April Sky Data**

#### Best time for deep sky observing this month: April 10 through April 19

**Mercury** passes in front of the Sun (inferior conjunction) on April 1st and, rising out of the Sun's glare, reaches greatest western elongation of 27 degrees on April 29th. But it never gets more than 10 degrees above the horizon even when furthest from the Sun.

**Venus**, seen low in the west after sunset, shines at magnitude -3.3 all month. Venus rises a little higher in the sky as April progresses, initially setting around one hour and a half after the Sun but increasing to two hours by month's end as its elevation at sunset increases from 18 to 25 degrees.

Now a morning object, **Mars** rises at around 2 am at the start of the month. During the month, Mars has a magnitude which increases from +0.4 to -0.2 and an angular size of 8.4 increasing to 11 arc seconds so, by month's end it should be possible to spot details on its salmon-pink surface.

**Jupiter** rises about three hours after sunset at the beginning of the month and about two hour earlier by month's end. Jupiter will transit before around 3:30 in early April and by around 1:30 at its end and so will enable the giant planet to be well seen with the equatorial bands, sometimes the Great (but reducing in size) Red Spot and up to four of its Gallilean moons.

**Saturn** rises at around 2:00 am at the start of the month and right at midnight at its end. With an angular size of ~16.7 arc seconds it climbs higher before dawn and so becomes easier to spot as the month progresses. The rings were at their widest a few months ago and are still, at 26 degrees to the line of sight, well open and spanning ~2.5 times the size of Saturn's globe.

The annual Lyrid **meteor shower** is active each year from about April 16 to 25. In 2018, the peak of this shower – which tends to come in a burst and usually lasts for less than a day – is expected to fall on the morning of April 22, with little or no interference from the waxing moon. All in all the Lyrid meteor shower prospects look pretty good for 2018

## Sun and Moon Rise and Set

| Date      | Moonrise | Moonset | Sunrise | Sunset |
|-----------|----------|---------|---------|--------|
| 4/1/2018  | 20:40    | 07:40   | 06:41   | 19:11  |
| 4/5/2018  | n/a      | 10:12   | 06:35   | 19:15  |

## **Desert Sky Observer**

# A.V.A.C. Information

Membership in the Antelope Valley Astronomy Club is open to any individual or family.

The Club has three categories of membership.

- Family membership at \$30.00 per year.
- Individual membership at \$25.00 per year.
- Junior membership at \$15.00 per year.

Membership entitles you to...

- Desert Sky Observer–monthly newsletter.
- The Reflector the publication of the Astronomical League.
- The A.V.A.C. Membership Manual.
- To borrow club equipment, books, videos and other items.

#### AVAC P.O. BOX 8545, LANCASTER, CA 93539-8545

Visit the Antelope Valley Astronomy Club website at <a href="http://www.avastronomyclub.org/">www.avastronomyclub.org/</a>

The Antelope Valley Astronomy Club, Inc. is a 501(c)(3) Non-Profit Corporation.

The A.V.A.C. is a Sustaining Member of The Astronomical League and the International Dark-Sky Association.

## **Board Members**

#### **President:**

Frank Moore (661) 972-4775 president@avastronomyclub.org

#### Vice-President:

Vacant vice-president@avastronomyclub.org

Secretary: Rose Moore (661) 972-1953 secretary@avastronomyclub.org

Treasurer: Rod Girard (661) 803-7838 treasurer@avastronomyclub.org

**Director of Community Development:** Robert Lynch, Jr. community@avastronomyclub.org

## **Appointed Positions**

Newsletter Editor: Steve Trotta (661) 269-5428 dso@avastronomyclub.org

Equipment & Library: Vacant library@avastronomyclub.org

Club Historian: Tom Koonce (661) 943-8200 history@avastronomyclub.org

#### Webmaster:

Steve Trotta (661) 269-5428 webmaster@avastronomyclub.org

#### Astronomical League Coordinator: Frank Moore (661) 972-4775 al@avastronomyclub.org
